

practical exam theory answers

① What is regression? How is it different from classification?

→ regression means predicting numerical values like, predicting house price, salary, marks

→ Classification is categorical prediction yes/no like email is spam or not, pass/fail etc

Real time example

Regression - house price, salary increment

Classification - email, transition group or/for spam

② What is the difference between SLR, MLR, L_1 L_2

→ SLR - use input feature to predict target value

⑩ $\rightarrow$ MLR = Use two or more features

= Ridge (L2) = Adds a penalty to large coefficients to reduce overfitting

= Lasso (L1) = Can make some coefficients zero and do feature selection

⑪ What is cross-validation (k-fold)?

$\rightarrow$ k-folds divide the dataset into k parts and give the best performing model
